No. 37 in the ADVANCES IN CHEMISTRY SERIES

REACTIONS OF COORDINATED LIGANDS AND HOMOGENEOUS CATALYSIS

The 18 papers in this volume explore an area which has recently taken on renewed life. All given before the Symposium on Homogeneous Catalysis and Reactions of Coordinated Ligands held by the Division of Inorganic Chemistry at the 141st ACS National Meeting in March 1962, they represent timely material.

Coordination chemists now are paying more attention to the ligands. Major developments which spotlight this area are (1) biochemical research which reveals the role of coordinated metal ions in biochemical synthesis and in energy storage and transfer, (2) the search for polymers which can withstand high temperatures, in turn, uncovering interesting ligand reactions, and (3) the discovery of the oxo- and the Ziegler-Natta catalytic syntheses which focus interest on coordination compounds as reaction intermediates.

Further investigation into ligand reactions is bound to be fruitful. If you are working anywhere in this field, you will need this volume as part of your literature.

255 pages.
