Platinum Laboratory Ware...

*Constantly Improved
for Over 75 Years!*

Platinum ware in a wide variety of items, each designed to meet the most stringent requirements of laboratory use, has been a Baker specialty for over 75 years . . . Constant study of laboratory needs has resulted in the development of the widely used platinum-rhodium alloy, in the reinforced rim design on crucibles and dishes, in development of the low form crucible, in the improved design of platinum electrodes and in new metallurgical processes that greatly increase the useful life of platinum ware . . . continuous study and experimentation in Baker's own laboratories helps to insure the continuity of improvement in design and utility.
